PROFESSIONAL SUMMARY

Diploma in Computer Science student with hands-on, self-directed experience across software engineering, systems design, and web development — from architecture through deployment. A fast learner with a strong analytical approach to problem-solving, comfortable working with multiple languages and paradigms, and experienced diagnosing and resolving real production issues independently. Available for Internship (Industry Training): start date from 1 November 2026, 12-week minimum duration (flexible to extend per company requirement).

EDUCATION

Diploma in Computer Science Expected Dec 2026
SEGi College, Kota Damansara | CGPA: 3.56

- Final Year Project: ProcraTrack — a dual-role student/lecturer procrastination-tracking web platform

PROJECT EXPERIENCE

ProcraTrack — Solo Software Engineering Project (Final Year Project) 2026
PHP · MySQL · JavaScript · Python (scripting) · System Design · XAMPP

- Designed and built a dual-role (student/lecturer) software system from the ground up, including database schema design, session/role architecture, and a full workflow engine for tasks, habits, and focus sessions — engineered solo across an 8-week development cycle
- Designed and implemented a weighted scoring algorithm (Procrastination Risk Index) combining 5+ input variables — overdue tasks, idle days, completion rate, upcoming deadlines, and habit consistency — into a single actionable metric
- Architected a role-based access control (RBAC) system with CSRF-protected approval flows, supporting secure cross-institution data requests between multiple user roles
- Built a messaging subsystem supporting group and direct chat with per-user message state handling and real-time-style unread tracking
- Integrated two independent third-party APIs (Telegram Bot API, Gmail SMTP via raw socket) to build a redundant, rule-based notification and scheduling engine
- Diagnosed and resolved a production performance bug caused by redundant/duplicate database queries, reducing unnecessary query load on page render
- Applied systematic debugging to trace and fix a logic inversion bug in a core scoring algorithm that was silently producing incorrect risk assessments
- Documented system architecture and presented technical design decisions (RBAC, CSRF protection, session isolation, password hashing, webhook architecture) to academic evaluators

Code: github.com/randomuserfella/FYP | Live portfolio: randomuserfella.github.io/Portfolio

TECHNICAL SKILLS

Languages: PHP, JavaScript, Python, C++, SQL, HTML/CSS
Core Concepts: Data structures, OOP, system design basics, RBAC, CSRF protection, session management, RESTful APIs
Frameworks/Libraries: Bootstrap 5, Chart.js, FullCalendar
Database: MySQL — schema design, query optimization
Tools & Platforms: XAMPP, ngrok, Git, VS Code
Integrations: Telegram Bot API, Gmail SMTP, Web Push (VAPID)

ADDITIONAL INFORMATION

- Available for Internship (Industry Training): start date from 1 November 2026, 12-week minimum duration, flexible to extend per company requirement
- Comfortable working independently and iteratively on ambiguous, evolving requirements
